

## A2 Mechanics Paper 4

Week 1

Sharon Zhou

# How was your summer?

ART1 Course Overview

## **Syllabus Overview**

#### Content overview

Content section	Assessment component		Topics included
 4 Mechanics	Paper 4	4.2 4.3 4.4	Forces and equilibrium Kinematics of motion in a straight line Momentum Newton's laws of motion Energy, work and power

List of formulae and statistical tables (MF19)

#### Structure

There are six components that can be combined in specific ways (please see below for details):

Paper 1: Pure Mathematics 1 Paper 4: Mechanics

Paper 2: Pure Mathematics 2 Paper 5: Probability & Statistics 1

Paper 3: Pure Mathematics 3 Paper 6: Probability & Statistics 2

All AS Level candidates take two written papers.

All A Level candidates take four written papers.

#### A Level Mathematics

The Cambridge International A Level Mathematics qualification offers two different options:

- Pure Mathematics, Mechanics and Probability & Statistics (Papers 1, 3, 4 and 5) or
- Pure Mathematics and Probability & Statistics (Papers 1, 3, 5 and 6).

# Structure of AS Level and A Level Mathematics AS Level Mathematics A Level Mathematics

Paper 1 and Paper 2

Pure Mathematics only

(No progression to A Level)

Paper 1 and Paper 4

Pure Mathematics and Mechanics

Paper 1 and Paper 5

Paper 1, 3, 5 and 6

Pure Mathematics and Probability & Statistics

## Assessment overview

#### Paper 4

Mechanics

1 hour 15 minutes

50 marks

6 to 8 structured questions based on the

Mechanics subject content

Written examination

Externally assessed

40% of the AS Level

20% of the A Level

Offered as part of AS Level or A Level

#### Cambridge International AS Level candidate grades March 2022

#### Cumulative world totals grades a - e

These figures may differ from those of March 2021 series because the population of candidates making entries was different. The awarding standard in March 2022 was aligned to that of equivalent qualifications taken in England in June 2021.

	% achieving	% candidates				
	а	b or above	c or above	d or above	e or above	ungraded
Accounting	31.9	44.3	56.8	66.7	80.9	19.1

## 4 Mechanics (for Paper 4)

Questions set will be mainly numerical, and will aim to test mechanical principles without involving difficult algebra or trigonometry. However, candidates should be familiar in particular with the following trigonometrical results:

$$\sin(90^{\circ} - \theta) \equiv \cos\theta$$
,  $\cos(90^{\circ} - \theta) \equiv \sin\theta$ ,  $\tan\theta \equiv \frac{\sin\theta}{\cos\theta}$ ,  $\sin^2\theta + \cos^2\theta \equiv 1$ .

Knowledge of algebraic methods from the content for Paper 1: Pure Mathematics 1 is assumed.

This content list refers to the equilibrium or motion of a 'particle'. Examination questions may involve extended bodies in a 'realistic' context, but these extended bodies should be treated as particles, so any force acting on them is modelled as acting at a single point.

Vector notation will not be used in the question papers.

## 4.1 Forces and equilibrium

#### Candidates should be able to:

- identify the forces acting in a given situation understand the vector nature of force, and find
- and use components and resultants
- use the principle that, when a particle is in equilibrium, the vector sum of the forces acting is zero, or equivalently, that the sum of the components in any direction is zero

understand that a contact force between two

- surfaces can be represented by two components, the normal component and the frictional component
- use the model of a 'smooth' contact, and
- understand the limitations of this model
- understand the concepts of limiting friction and limiting equilibrium, recall the definition of
- coefficient of friction, and use the relationship  $F = \mu R$  or  $F \leq \mu R$ , as appropriate
- use Newton's third law.

e.g. by drawing a force diagram.

Notes and examples

- Calculations are always required, not approximate
- solutions by scale drawing. Solutions by resolving are usually expected, but equivalent methods (e.g. triangle of forces, Lami's
- Theorem, where suitable) are also acceptable; these other methods are not required knowledge, and will not be referred to in questions.

ground on the particle.

- Terminology such as 'about to slip' may be used to mean 'in limiting equilibrium' in questions.
- e.g. the force exerted by a particle on the ground is equal and opposite to the force exerted by the

#### 4.2 Kinematics of motion in a straight line

#### Candidates should be able to:

- understand the concepts of distance and speed as scalar quantities, and of displacement, velocity and acceleration as vector quantities
- sketch and interpret displacement–time graphs and velocity–time graphs, and in particular appreciate that
  - the area under a velocity-time graph represents displacement,
  - the gradient of a displacement–time graph represents velocity,
  - the gradient of a velocity-time graph represents acceleration
- use differentiation and integration with respect to time to solve simple problems concerning displacement, velocity and acceleration
- use appropriate formulae for motion with constant acceleration in a straight line.

#### Notes and examples

Restricted to motion in one dimension only.

The term 'deceleration' may sometimes be used in the context of decreasing speed.

Calculus required is restricted to techniques from the content for Paper 1: Pure Mathematics 1.

Questions may involve setting up more than one equation, using information about the motion of different particles.

#### 4.3 Momentum

#### Candidates should be able to:

- use the definition of linear momentum and show understanding of its vector nature
- use conservation of linear momentum to solve problems that may be modelled as the direct impact of two bodies.

#### Notes and examples

For motion in one dimension only.

Including direct impact of two bodies where the bodies coalesce on impact.

Knowledge of impulse and the coefficient of restitution is not required.

#### 4.4 Newton's laws of motion

#### Candidates should be able to:

- apply Newton's laws of motion to the linear motion of a particle of constant mass moving under the action of constant forces, which may include friction, tension in an inextensible string and thrust in a connecting rod
- use the relationship between mass and weight
- solve simple problems which may be modelled as the motion of a particle moving vertically or on an inclined plane with constant acceleration
- solve simple problems which may be modelled as the motion of connected particles.

#### Notes and examples

If any other forces resisting motion are to be considered (e.g. air resistance) this will be indicated in the question.

W = mg. In this component, questions are mainly numerical, and use of the approximate numerical value 10 (m s<sup>-2</sup>) for g is expected.

Including, for example, motion of a particle on a rough plane where the acceleration while moving up the plane is different from the acceleration while moving down the plane.

e.g. particles connected by a light inextensible string passing over a smooth pulley, or a car towing a trailer by means of either a light rope or a light rigid towbar.

#### 4.5 Energy, work and power

#### Candidates should be able to:

- understand the concept of the work done by a force, and calculate the work done by a constant force when its point of application undergoes a displacement not necessarily parallel to the force
- understand the concepts of gravitational potential energy and kinetic energy, and use appropriate formulae
- understand and use the relationship between the change in energy of a system and the work done by the external forces, and use in appropriate cases the principle of conservation of energy
- use the definition of power as the rate at which a force does work, and use the relationship between power, force and velocity for a force acting in the direction of motion
- solve problems involving, for example, the instantaneous acceleration of a car moving on a hill against a resistance.

#### Notes and examples

 $W = Fd\cos\theta$ ;

Use of the scalar product is not required.

Including cases where the motion may not be linear (e.g. a child on a smooth curved 'slide'), where only overall energy changes need to be considered.

Including calculation of (average) power as

Work done
Time taken

P = Fv.

1. Motion in a straight line 2. The constant acceleration formulae 3. Forces and Newton's laws of motion 4. Applying Newton's second law along a line 5. Vectors **A Level Mechanics** 6. Forces in equilibrium and resultant forces 7. General motion in a staright line 8. A model for friction 9. Energy, work and power 10. Momentum

1. Velocity and acceleration 2. Force and motion in one dimension 3. Forces in two dimensions 4. Friction 9709 Paper 4 5. Connected particles **Mechanics** 6. General motion in a straight line 7. Momentum 8. Work and energy 9. The work-energy principle and power

## List of formulae and statistical tables (MF19)

#### **MECHANICS**

Uniformly accelerated motion

$$v = u + at$$
,

$$s = \frac{1}{2}(u+v)t,$$

$$v = u + at$$
,  $s = \frac{1}{2}(u + v)t$ ,  $s = ut + \frac{1}{2}at^2$ ,  $v^2 = u^2 + 2as$ 

$$v^2 = u^2 + 2as$$

#### **FURTHER MECHANICS**

Motion of a projectile

Equation of trajectory is:

$$y = x \tan \theta - \frac{gx^2}{2V^2 \cos^2 \theta}$$

Elastic strings and springs

$$T = \frac{\lambda x}{l}$$
,

$$E = \frac{\lambda x^2}{2l}$$

Motion in a circle

For uniform circular motion, the acceleration is directed towards the centre and has magnitude

$$\omega^2 r$$
 or  $\frac{v^2}{r}$ 

Centres of mass of uniform bodies

Triangular lamina:  $\frac{2}{3}$  along median from vertex

Solid hemisphere of radius r:  $\frac{3}{8}r$  from centre

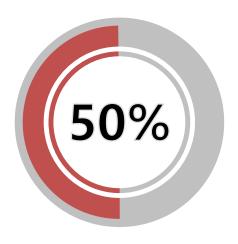

Hemispherical shell of radius r:  $\frac{1}{2}r$  from centre

Circular arc of radius r and angle  $2\alpha$ :  $\frac{r \sin \alpha}{\alpha}$  from centre

Circular sector of radius r and angle  $2\alpha$ .  $\frac{2r\sin\alpha}{3\alpha}$  from centre

Solid cone or pyramid of height h:  $\frac{3}{4}h$  from vertex

End-of-chapter review exercise 1			

# **Chapter 1**Velocity and acceleration

#### In this chapter you will learn how to:

- work with scalar and vector quantities for distance and speed
- use equations of constant acceleration
- sketch and read displacement-time graphs and velocity-time graphs
- solve problems with multiple stages of motion.

#### PREREQUISITE KNOWLEDGE

Where it comes from	What you should be able to do	Check your skills		
IGCSE® / O Level Mathematics	Solve quadratics by factorising or using the quadratic formula.	1 Solve the following equations. a $x^2 - 2x - 15 = 0$ b $2x^2 + x - 3 = 0$ c $3x^2 - 5x - 7 = 0$		
IGCSE / O Level Mathematics	Solve linear simultaneous equations.	<ul> <li>2 Solve the following pairs of simultaneous equations.</li> <li>a 2x + 3y = 8 and 5x - 2y = 1</li> <li>b 3x + 2y = 9 and y = 4x - 1</li> </ul>		

#### What is Mechanics about?

How far should the driver of a car stay behind another car to be able to stop safely in an emergency? How long should the fuse on a firework be so the firework goes off at the highest point? How quickly should you roll a ball so it stops as near as possible to a target? How strong does a building have to be to survive a hurricane? Mechanics is the study of questions such as these. By modelling situations mathematically and making suitable assumptions you can find answers to these questions.

In this chapter, you will study the motion of objects and learn how to work out where an object is and how it is moving at different times. This area of Mechanics is known as 'dynamics'. Solving problems with objects that do not move is called 'statics'; you will study this later in the course.

## **Vectors and Scalars**

## Example

Mass

Ammount of matter

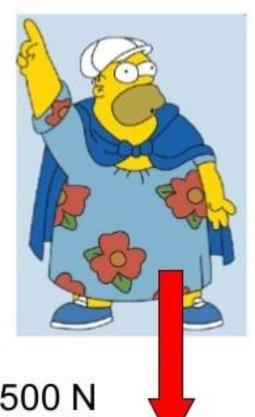

Scalar: 150 Kg

Weight (Force)

Attraction
of an
ammount
of matter
to the Earth

Vector: 1500 N

**Distance**: scalar; measure the total length of path travelled **Displacement**: vector; gives the location of an object relative to a fixed reference point or *origin*.

- to define displacement you need to first define positive direction.

## (A) KEY POINT 1.1

Displacement is a measure of location from a fixed origin or starting point. It is a vector and so has both magnitude and direction. If you take displacement in a given direction to be positive, then displacement in the opposite direction is negative.

Since you will be working in only one dimension, you will often refer to the displacement as just a number, with positive meaning a displacement in one direction from the origin and negative meaning a displacement in the other direction. Sometimes the direction and origin will be stated in the problem. In other cases, you will need to choose these yourself. In many cases the origin will simply be the starting position of an object and the positive direction will be the direction the object is moving initially.

Speed: scalar

**Velocity**: vector

- define positive direction.

For an object moving at constant speed, if you know the distance travelled in a given time you can work out the speed of the object.

### (A) KEY POINT 1.2

For an object moving at constant speed:

$$speed = \frac{distance covered}{time taken}$$

This is valid only for objects moving at constant speed. For objects moving at nonconstant speed you can consider the average speed.

#### (A) KEY POINT 1.3

average speed = 
$$\frac{\text{total distance covered}}{\text{total time taken}}$$

Velocity measures how quickly the displacement of an object changes. You can write an equation similar to the one for speed.

### (A) KEY POINT 1.4

For an object moving at constant velocity:

$$velocity = \frac{change in displacement}{time taken}$$

As with speed, for objects moving at non-constant velocity you can consider the average velocity.

#### (A) KEY POINT 1.5

average velocity = 
$$\frac{\text{net change in displacement}}{\text{total time taken}}$$

a vector.

We use vertical lines to indicate magnitude of

So, speed = velocity

We can rearrange the equation for velocity to deduce that for an object moving at constant velocity v for time t, the change in displacement s (in the same direction as the velocity) is given by:

s = vt

The standard units used for distance and displacement are metres (m) and for time are seconds (s). Therefore, the units for speed and velocity are metres per second (usually written in mathematics and science as m s<sup>-1</sup>, although you may also come across the notation m/s). These units are those specified by the *Système Internationale* (SI), which defines the system of units used by scientists all over the world. Other commonly used units for speed include kilometres per hour (km/h) and miles per hour (mph).

A car travels 9 km in 15 minutes at constant speed. Find its speed in m s<sup>-1</sup>.

$$9 \text{ km} = 9000 \text{ m}$$
 and  $15 \text{ minutes} = 900 \text{ s}$ 

Convert to units required for the answer, which are SI units.

$$s = vt$$

$$so 9000 = 900v$$

$$v = 10 \text{ m s}^{-1}$$

Substitute into the equation for displacement and solve.

A cyclist travels at 5 m s<sup>-1</sup> for 30 s then turns back, travelling at 3 m s<sup>-1</sup> for 10 s. Find her displacement in the original direction of motion from her starting position.

$$s = vt$$
 and  $s_2 = -3 \times 10$   
So  $s_1 = 5 \times 30$  = -30  
= 150

Separate the two stages of the journey.

Remember travelling back means a negative velocity and a negative displacement.

So the total displacement is

$$s = 150 + (-30)$$
  
= 120 m

A cyclist spends some of his journey going downhill at 15 m s<sup>-1</sup> and the rest of the time going uphill at 5 m s<sup>-1</sup>. In 1 minute he travels 540 m. Find how long he spent going downhill.

Let t be the amount of time spent going downhill.

Define the variable.

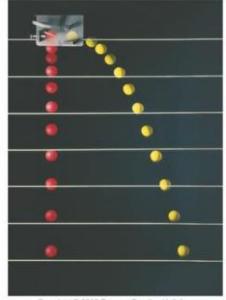

Then 60 - t is the amount of time spent going uphill.

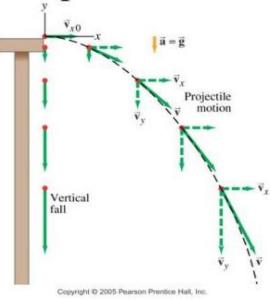

Write an expression for the time spent travelling uphill.

Total distance = 
$$15t + 5(60 - t) = 540$$
  
 $15t + 300 - 5t = 540$   
 $10t = 240$   
 $t = 24s$ 

#### **Vectors & Scalars**

- •A <u>vector</u> has magnitude as well as direction.
- •Examples: displacement, velocity, acceleration, force, momentum
- •A <u>scalar</u> has only magnitude
- •Examples: time, mass, temperature

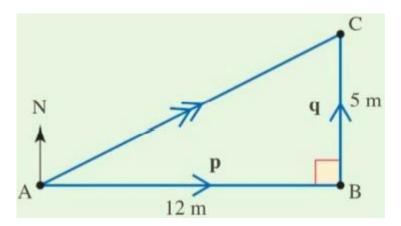

Copyright © 2005 Pearson Prentice Hall, Inc.

If you walk 12 m east and then 5 m north, how far and in what direction will you be from your starting point?

You write the vectors as  $\overrightarrow{AB}$  and  $\overrightarrow{BC}$  The arrow above the letters is very important as it indicates the direction of the vector.  $\overrightarrow{AB}$  means from A to B.  $\overrightarrow{AB}$  and  $\overrightarrow{BC}$  are examples of **displacement vectors**. Their lengths represent the magnitude of the displacements.

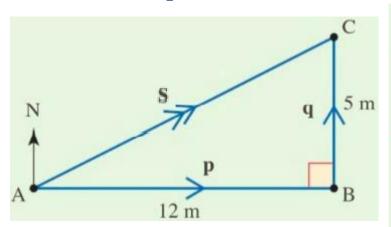

The magnitudes of  $\mathbf{p}$  and  $\mathbf{q}$  are then shown as  $|\mathbf{p}|$  and  $|\mathbf{q}|$  or p and q (in italics). These are scalar quantities.

$$p = 12$$

$$q = 5$$

$$s = \sqrt{12^2 + 5^2}$$

The combined effect of the two displacements  $\overrightarrow{AB}$  (=  $\mathbf{p}$ ) and  $\overrightarrow{BC}$  (=  $\mathbf{q}$ ) is  $\overrightarrow{AC}$  and this is called the **resultant vector**. It is marked with two arrows to distinguish it from  $\mathbf{p}$  and  $\mathbf{q}$ . The process of combining vectors in this way is called **vector addition**. You can write  $\overrightarrow{AB} + \overrightarrow{BC} = \overrightarrow{AC}$  or  $\mathbf{p} + \mathbf{q} = \mathbf{s}$ .

You can use Pythagoras' theorem and trigonometry to calculate the resultant.

In triangle ABC 
$$AC = \sqrt{12^2 + 5^2} = 13$$
  
and  $\tan \alpha = \frac{12}{5}$   
 $\alpha = 67^{\circ}$  (to the nearest degree)

The distance from the starting point is 13 m and the direction is 067°.

- A bird is caught in a wind blowing east at  $12 \,\mathrm{m\,s^{-1}}$  and flies so that its speed would be  $5 \,\mathrm{m\,s^{-1}}$  north in still air. What is its actual velocity?
- A sledge is being pulled by two children with forces of 12 N east and 5 N north. What single force would have the same effect?

## Homework: EXERCISE 1A

- The speed of light is  $3.00 \times 10^8$  m s<sup>-1</sup> to 3 significant figures. The average distance between the Earth and the Sun is 150 million km to 3 significant figures. Find how long it takes for light from the Sun to reach the Earth on average. Give the answer in minutes and seconds.
- 6 A runner runs at  $5 \,\mathrm{m\,s^{-1}}$  for 7s before increasing the pace to  $7 \,\mathrm{m\,s^{-1}}$  for the next 13s.
  - a Find her average speed.
  - b What assumptions have been made to answer the question?
  - A remote control car travels forwards at  $6 \,\mathrm{m\,s^{-1}}$  in Drive and backwards at  $3 \,\mathrm{m\,s^{-1}}$  in Reverse. The car travels for  $10 \,\mathrm{s}$  in Drive before travelling for  $5 \,\mathrm{s}$  in Reverse.
    - a Find its displacement from its starting point.
    - b Find its average velocity in the direction in which it started driving forwards.
    - c Find its average speed.
- 11 Two cars are racing over the same distance. They start at the same time, but one finishes 8s before the other. The faster one averaged 45 m s<sup>-1</sup> and the slower one averaged 44 m s<sup>-1</sup>. Find the length of the race.
- 12 Two air hockey pucks are 2 m apart. One is struck and moves directly towards the other at 1.3 m s<sup>-1</sup>. The other is struck 0.2 s later and moves directly towards the first at 1.7 m s<sup>-1</sup>. Find how far the first puck has moved when the collision occurs and how long it has been moving for.

#### 1.2 Acceleration

Velocity is not the only measure of the motion of an object. It is useful to know if, and how, the velocity is changing. We use acceleration to measure how quickly velocity is changing.

#### (A) KEY POINT 1.6

For an object moving at constant acceleration,

$$acceleration = \frac{\text{change in velocity}}{\text{time taken}}$$

If an object has constant acceleration a, initial velocity u and it reaches final velocity v in time t, then

$$a = \frac{v - u}{t}$$

where u, v and a are all measured in the same direction.

#### **EXPLORE 1.2**

If the initial velocity is negative, what effect would a positive acceleration have on the car? Would it be moving more quickly or less quickly?

What effect would a negative acceleration have on the car in this situation? Would it be moving more quickly or less quickly?

When the acceleration is constant, the average velocity is simply the average of the initial and final velocities, which is given by the formula  $\frac{1}{2}(u+v)$ . This can be used to find displacements using the equation for average velocity from Key Point 1.5.

#### (D) KEY POINT 1.7

If an object has constant acceleration a, initial velocity u and it reaches final velocity v in time t, then the displacement s is given by

$$s = \frac{1}{2} (u + v)t$$

A parachutist falls from rest to 49 m s<sup>-1</sup> over 5 s. Find her acceleration.

$$a = \frac{v - u}{t}$$
$$= \frac{49 - 0}{5}$$
$$= 9.8 \,\mathrm{m \, s^{-2}}$$

A tractor accelerates from 5 m s<sup>-1</sup> to 9 m s<sup>-1</sup> at 0.5 m s<sup>-2</sup>. Find the distance covered by the tractor over this time.

$$a = \frac{v - u}{t}$$
So  $0.5 = \frac{9 - 5}{t}$ 

$$0.5t = 4$$

$$t = 8s$$

Substitute into  $a = \frac{v - u}{t}$  first to find t.

$$s = \frac{1}{2} (u + v)t$$
$$= \frac{1}{2} (5 + 9) \times 8$$
$$= 56 \text{ m}$$

Substitute into  $s = \frac{1}{2}(u+v)t$  to find s.

#### **EXERCISE 1B**

- 1 A car accelerates from 4 m s<sup>-1</sup> to 10 m s<sup>-1</sup> in 3s at constant acceleration. Find its acceleration.
- Z
- 2 A car accelerates from rest to  $10 \,\mathrm{m\,s^{-1}}$  in 4s at constant acceleration. Find its acceleration.
- 3 A car accelerates from  $3 \,\mathrm{m \, s^{-1}}$  at an acceleration of  $6 \,\mathrm{m \, s^{-2}}$ . Find the time taken to reach  $12 \,\mathrm{m \, s^{-1}}$ .
- 4 An aeroplane accelerates at a constant rate of 3 m s<sup>-2</sup> for 5 s from an initial velocity of 4 m s<sup>-1</sup>. Find its final velocity.
- Ø
- 5 A speedboat accelerates at a constant rate of 1.5 m s<sup>-2</sup> for 4s, reaching a final velocity of 9 m s<sup>-1</sup>. Find its initial velocity.
- - 6 A car decelerates at a constant rate of 2 m s<sup>-2</sup> for 3s, finishing at a velocity of 8 m s<sup>-1</sup>. Find its initial velocity.
  - 7 A car accelerates from an initial velocity of 4 m s<sup>-1</sup> to a final velocity of 8 m s<sup>-1</sup> at a constant rate of 0.5 m s<sup>-2</sup>. Find the car's displacement in that time.

#### **Homework 1B:**

- 9 A wagon is accelerating down a hill at constant acceleration. It took 1s more to accelerate from a velocity of 1 m s<sup>-1</sup> to a velocity of 5 m s<sup>-1</sup> than it took to accelerate from rest to a velocity of 1 m s<sup>-1</sup>. Find the acceleration.
- 10 A driver sees a turning 100 m ahead. She lets her car slow at constant deceleration of 0.4 m s<sup>-2</sup> and arrives at the turning 10 s later. Find the velocity she is travelling at when she reaches the turning.
- 11 A cyclist is travelling at a velocity of  $10 \,\mathrm{m\,s^{-1}}$  when he reaches the top of a slope, which is  $80 \,\mathrm{m}$  long. There is a bend at the bottom of the slope, which it would be dangerous to go round any faster than  $11 \,\mathrm{m\,s^{-1}}$ . Because of gravity, if he did not pedal or brake he would accelerate down the slope at  $0.1 \,\mathrm{m\,s^{-2}}$ . To go as fast as possible but still reach the bottom at a safe speed should the cyclist brake, do nothing or pedal?
